

# Radiology Report – Chest X-ray (Post-Lung Surgery)

## Patient Information

Name: Alexander "Alex" Parker  
MRN: 12345678  
DOB: 1983-08-14 (Age 42)  
Sex: Male

## Exam Details

Exam: Chest X-ray (PA and Lateral views)  
Accession #: RAD-2025-05-04-01  
Date of Exam: 2025-05-04 09:20 AM (Post-op day 3)  
Indication: Status post right upper lobectomy for NSCLC  
Technique: Upright, digital detector, standard exposure

## Imaged View

## Findings

Right hemithorax demonstrates interval partial resection; right upper lung field shows expected post-lobectomy volume loss with surgical staple line visualized. Small right apical pneumothorax is not identified; lung edge closely apposed to chest wall. Minimal right pleural effusion layering laterally; costophrenic angle blunting. Mild shift of mediastinum toward operative side consistent with expected postoperative volume loss; heart size remains within normal limits. Subsegmental atelectasis noted in right lower lobe; left lung clear.
